Subject Summary of Traffic Impact Analysis in the Context of the Sunnyvale
Decision

Based on the December 2010 court ruling in Northern California, *Sunnyvale West Neighborhood Assn, et al v. City of Sunnyvale City Council*, the court directed that existing conditions are to be used as the baseline for evaluating the impacts of a proposed project. The traffic analysis in the Program EIR for the Oceanside General Plan Circulation Element Update provides a comparison of the traffic impacts of the three project alternatives to existing conditions.

The Circulation Element Update aims to modify the current 1995 roadway network plan and identify the level of service on multiple intersections and roadways throughout the City. The Program EIR for the Circulation Element Update includes an analysis for the existing conditions scenario, the 1995 Circulation Element (slightly modified) scenario, and two additional 2030 network alternatives. The following tables provide a summary of the level of service analysis for both intersections and roadway segments for the existing and future scenarios. Detailed analysis results which include the volume-to-capacity ratio for segments and delay for intersections can be found in Appendix E of the Oceanside Circulation Element Update Program EIR. The City of Oceanside's acceptable level of service for intersections and segments is LOS D. Any segment or intersection analyzed in the Circulation Element Update that does not operate at LOS D in the 2030 future scenario is deemed to have an impact and mitigation measures are recommended for the facility in the Program EIR under Section 4.2.4.

Footnotes:

- LOS = Level of Service
- These intersection calculations were done in Traffix using 2000 HCM methodologies. Synchro only allows geometry of 2-lanes per leg for AWSC intersections.
- AWSC – all way stop controlled intersection

Notes:

- Acceptable level of service at intersections in Oceanside is LOS D.
- Bold** and red/orange shading indicates an unacceptable level of service.
