Prepared By:

This Drainage Study has been prepared by Kimley-Horn and Associates, Inc. under the direct supervision of the following Registered Civil Engineer. The undersigned attests to the technical data contained in this study, and to the qualifications of technical specialists providing engineering computations upon which the recommendations and conclusions are based.

## 1 INTRODUCTION

This Drainage Report has been prepared for the City of Oceanside to document the engineering analysis used in the drainage evaluation and design for the proposed ONPOINT Oceanside in Oceanside, CA. The project site is located at North West Corner of Intersection of Mission Ave and Foussat Rd. See **Figure 1** for vicinity map.

The developer is proposing to construct a new mixed use commercial development on the 3.728 ac site. The site has previously been mass-graded and is currently undeveloped.

The development will include seven (7) proposed buildings, one fueling island and various landscape areas. The site will also include sidewalks, landscaping and underground infiltration basins.

## 2 PROCEDURE AND METHODOLOGIES

Hydrologic calculations were completed using the San Diego County Hydrology Manual. Pertinent excerpts from the manual are included in **Appendix B**. The Rational Method was used to determine the peak discharge for the proposed improvements. This formula is expressed as:

$$Q = CIA$$

Q= peak discharge (cfs)

C= runoff coefficient

I= intensity (in/hr)

A= area (acres)

Runoff coefficients are based on land use and soil type B for the project. Rainfall intensity is based on the selected storm frequency, 6-hour storm rainfall amount, and duration. The rainfall intensity equation is as follows:

$$I = 7.44P_6D^{-0.645}$$

I=Intensity (in/hr)

P<sub>6</sub>=6-Hour Precipitation (in)

D= Duration (min)

P<sub>6</sub> was determined using San Diego County Hydrology Manual's Isopluvial maps for each frequency storm. Duration is equal to the Time of Concentration (T<sub>c</sub>) for a selected storm frequency; T<sub>c</sub> = 5 min was used for all drainage basins for this project due to the small areas delineated.

Per the City of Oceanside SUSMP dated March 2010, peak flow rates were calculated for the 2, 10, and 100-year storm.

Runoff coefficients are based on land use and soil type B for this project. For the existing conditions, a runoff coefficient of 0.67 was used for the native grade area. For the proposed conditions, a runoff coefficient of 0.85 was used due to the use determination as general commercial. The runoff coefficients were determined using the AES modeling software and guidance from Table 3-1 in the San Diego County Hydrology Manual.

### 3 EXISTING DRAINAGE

The site is bounded by an existing development to the south west, Mission Ave the south east, Foussat Rd to the north east and State Route 76 to the north west.

Stormwater runoff from surrounding offsite areas does not enter the proposed project site. The site is bounded on three sides by roads/parking with curb and gutter and on the other side by vegetation. Water sheet flows across the proposed site towards the north corner. An existing stormwater conveyance captures the runoff and outfalls into an existing underground box culvert. The box culvert provides conveyance of the water underneath SR 76 and outlets into open channel on the north side of SR 76. The open channel discharges directly into San Luis Rey River. A small area near the north west side of the property has a cross slope and flows away from the rest of the site towards the existing development along the south west side of the property.

See **Appendix A** for existing hydrology exhibit, which shows the existing drainage areas and flow paths illustrating the direction of offsite flow.

See **Appendix B** for existing hydrology calculations, summarized below:

**Table 1 – Existing Hydrology Calculations**

Basin	Area (SF)	Q <sub>2</sub> (cfs)	Q <sub>10</sub> (cfs)	Q <sub>100</sub> (cfs)
A	149,411	3.78	5.48	8.26
B	13,068	0.67	0.94	1.37

## 4 PROPOSED DRAINAGE

The proposed development will require a large amount of fill to meet the minimum flood plain requirements. The existing hydrology will be modified to account for new elevations for the proposed buildings and associated hardscaping. The project site is favorable for infiltration and underground infiltration areas will be constructed to meet water quality and hydromodification requirements.

The proposed underground infiltration areas will treat runoff from the majority of the project site. Landscape areas required along the south east and northeast side of the project to satisfy existing easements and city set back requirements will be self-mitigating areas and not require BMP control.

Catch basins throughout the project site will capture all stormwater including water discharged at the surface from roof drains. All stormwater will be directed to the underground infiltration areas to be retained and infiltrated via Stormtech 4500 system. The system has been designed to capture 100% of all stormwater with zero discharge for any storm event up to a 100 year event. In order to provide an additional factor of safety, the system was design for “instantaneous” volume to ensure adequate retention for any event up to a 100 year storm. The factored infiltration rate of 1.4 inch/hr was used to determine the required draw down time for each of the four proposed basins via City of Oceanside Worksheet B.4-1. All four basins adequately drawn down within 36 hours as required per the City of Oceanside Standards. Due to the proposed use of the underground infiltration areas no hydraulic calculations are available at this time.

See **Appendix A** for proposed drainage exhibit, and **Appendix B** for proposed hydrology calculations, summarized below:

**Table 2 – Proposed Hydrology Calculations**

Basin	Area (SF)	Q <sub>2</sub> (cfs)	Q <sub>10</sub> (cfs)	Q <sub>100</sub> (cfs)
A	27,000	1.61	2.25	3.35
B	55,758	3.14	4.51	6.59
C	10,033	0.62	0.87	1.26
E	41,483	2.28	3.25	4.82
